# Empirical studies in building the risk averse portfolio model 

C. Kanagaraj, Santhosh Raja R

#### Abstract

The present research article aims at exploring the possibilities of building a portfolio with minimum risk. There are numerous articles and book written on portfolio models which could bring greater returns with minimum risk. The risk and return go hand in hand but as an investor one wants more return and less risk. Almost all portfolio theories are against single stock investing. They suggest a portfolio stocks from unrelated sectors or industries to mitigate risk. There is no way to secure oneself from systematic risk in the field of investment, but a right portfolio could bring down unsystematic risk considerably. However, such portfolio building requires a lot of financial acumen and experience in using mathematical techniques a model. By keeping such difficulties in mind, a constant index portfolio model is proposed and empirically tested for a period of ten years to validate the model. In this model, stock selection for the portfolio is done by the index itself and even a novice in the field of investment could understand the model without much of difficulty.

Keywords: Risk Averse Portfolio Model, Portfolio Building, Portfolio Risk, portfolio return, systematic risk, unsystematic risk.

## Introduction

By definition disposal income is shared between consumption and savings. Financialising the savings is the best way to preserve the value of money against the odds of inflation. Risk free returns are always less Most of the time, the real rate of return is zero, if not, negative. Moreover, zero interest rate regimes and negative interest rate regimes are potential threat to fall back on fixed returns with risk free approach for investing.
Market oriented investments are considered to be the best insurance for preserving the value of money with positive bias. The issue here is, such investments come with risk. Risk and returns go hand in hand. This Discourages risk averters to invest in any market-based investments.
Harry Max Markowitz, the 1990 Nobel Prize winners explains the risk-return trade off in a simpler way.

## Correspondence:

Business School, India.

Expected

Normally, Investors demand a return for delaying their consumption. To convince them to take on added risk, they demand a higher expected return.

## Investment Alternatives

Among the plethora of investment avenues, an investor can choose the right one based on risk-return dynamics, liquidity, tax saving, marketability, etc. Non- marketable financial asset like bank deposits, Post office deposits, Fixed deposits, Public provident fund, National savings certificate, Kisan vikas patra, among others ensure a fixed return and mostly risk-free. Individual Investors hardly participate in money market instruments like treasury bills, commercial papers etc. Fixed Income securities like Bonds and Debentures are slowly making inroads with High-Networth Individuals (HNIs). Real Estate, Gold, Silver, Commodities, Art Objects and Antiques are there for people who are ready for lumpsum payments.
Equity shares and financial derivatives are there for direct investment. Mutual Funds, ULIPs and other insurance products (Unit Linked Insurance Product) are known as indirect investments. Financial Derivatives have short expiry period and highly leveraged by nature. Derivatives markets are for risk lovers and anybody can participate by paying the margin money. Risk averters do a lot of analysis before putting their money in equities, mutual funds and ULIPs. Unless they see a high probability of return over risk, their participation is doubtful.

## Portfolio Building: A Mathematical Conundrum.

Direct participation in the stock market is exciting but involves the risk of losing the capital invested. Like a double-edged knife, either the market can reward the investors or punish him. Not everyone is well versed with the technical and fundamental analysis. Fear and greed disarm anybody from going for a rational approach and most of the time people succumb to their emotions. That results in wrong entry and wrong exit leading to huge losses.
Ample study materials are available for mastering oneself for doing stock market analysis. Ben Graham's value investing, Joel Greenblatt's Magic formula, Warren Buffet to coffee can portfolio by Saurabh mukherjea to hundreds
of books on portfolio management available for learning and understanding. But there is guarantees for success in the market by following any of them.
The main objective of every investor is to maximize returns, subject to constraints, primarily risk. Dividend yield and capital gains/loss constitute the total return. Some people calculate the return relative in their analysis. Risk is a mixture of danger and opportunity. Total risk involves systematic risk and unsystematic (unique) risk.
Measuring expected (ex Aute) return and risk is easy by calculating the probable outcomes.
Expected Return $=\sum_{i=1}^{n 1}$ PiRi
Risk $($ Standard Deviation $)=\sum_{i=1}^{n 1}\left[P i(R i-R i)^{2}\right]^{1 / 2}$
Where Pi is the probability of occurrence,
Ri is the rate of return.
This is simple to compute, but portfolios which are combination of securities do not take the aggregate characteristics of risk and return in the same direction as compared to their individual parts. Smart investors do not put their money in a single stock - 'all the eggs into a single basket '. An article by Markowitz in the journal of finance 1952, was the first scientific approach to determine the risk, return, covariance of the securities and developed a methodology for determining the optimum portfolio.
Though systematic risk cannot be solved by building portfolio of securities, the unsystematic risk could be minimised by doing so.
From the portfolio theories, it is given that
Risk of a portfolio (two Securities model) $=\sigma_{p}^{2}=$ $\sigma_{A}^{2} W_{A}^{2}+\sigma_{B}^{2} W_{B}^{2}+2 r \sigma_{A} \sigma_{B} W_{A} W_{B}$
Where $\mathrm{W}_{\mathrm{A}}$ - is the portfolio of amount invested in security A and
$\mathrm{W}_{\mathrm{B}}-$ is the portfolio of amount invested in security B.

Customarily, portfolio risk is measured by the help of Covariance or Coefficient of correlation. With the help of either any one of these, an investor can reduce his risk sustainability. Covariance is the relationship or responsiveness of returns between two securities - how they change with each other.
For historical (ex-post) data, we use the formula: $\frac{1}{N}+$
$\sum\left(R_{A}-R_{A}\right)\left(R_{B}-R_{B}\right)$
Where $\mathrm{R}_{\mathrm{A}}$ denotes return from security A and
$R_{B}$ denotes return from security $B$.
N - is number of terms.
For the future (ex-ante) returns

$$
\sum_{i=0}^{n} P i\left(R_{i A}-R_{A}\right)\left(R_{i B}-R_{B}\right)
$$

Where Pi denotes the probable outcomes under various situations; and
$R_{i A}$ and $R_{i B}$ are the return on Security $A$ and $B$
under various situations.
After Assuming state of economy in the future, assign probability value for each occurrence. The return of securities and their associated probabilities need to be considered for calculation return and risk.

## Illustration

| State of the <br> Economy | Probability | Return <br> Security $\mathbf{X}$ <br> $(\boldsymbol{\%})$ | Return <br> Security Y <br> $(\boldsymbol{\%})$ | Deviation of Return <br> of Sec X from the <br> Mean | Deviation of Return <br> of Sec Y from the <br> Mean | Product of <br> Deviation * <br> Probability |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0.10 | 15 | 17 | 6 | 7 | 4.2 |
| 2 | 0.20 | 12 | 16 | 3 | 6 | 3.6 |
| 3 | 0.25 | 11 | 14 | 2 | 4 | 2.0 |
| 4 | 0.15 | -7 | 9 | -16 | -1 | -2.4 |
| 5 | 0.30 | 14 | -6 | 5 | -16 | -9.0 |

The expected return on Security X:

$$
\begin{aligned}
\mathrm{E}\left(\mathrm{R}_{\mathrm{x}}\right) & =(.10 * 15)+(.20 * 12)+(.25 * 11)+(.15 *-7) \\
+(0.30 * 14) & \\
& =1.5+2.4+2.75-1.05+4.2 \\
& =9.8 \%
\end{aligned}
$$

The expected Return on Security Y:
$\mathrm{E}\left(\mathrm{R}_{\mathrm{x}}\right)=(.10 * 17)+(.20 * 16)+(.25 * 14)+\left(.15^{*}-9\right)+$ (0.30*-6)

$$
\begin{aligned}
& =.7+3.2+3.5+4.5-1.8 \\
& =10.6 \%
\end{aligned}
$$

Covariance between X and $\mathrm{Y}=1.6$
Standard Deviation

$$
\begin{aligned}
\sigma \mathrm{x}=\left(0.1(6)^{2}+0.2(3)^{2}+0.25\right. & (2)^{2}+0.15(-16)^{2}+0.3(5)^{2} \\
& =3.6+1.8+1.0+38.4+7.5 \\
& =52.5 \\
\sigma \mathrm{x}= & 7.23 \% \\
\sigma \mathrm{y}=\left(0.1(7)^{2}+0.2(6)^{2}+0.25\right. & (4)^{2}+0.15(-1)^{2}+0.3(-6)^{2} \\
& =4.9+7.2+2.0+0.15+10.8 \\
& =25.05 \\
\sigma \mathrm{y}= & 5 \%
\end{aligned}
$$

Now, the correlation Coefficient $\mathrm{r}=\frac{\operatorname{Cov}(X, Y)}{\sigma_{x} \sigma_{y}}=\frac{1.6}{7.23 * 5}=\frac{1.6}{36.15}$ $=0.04$
It is obvious from the statistical theory that when the ' $r$ ' value is negative, the portfolio risk could be reduced. When the ' $r$ ' value is zero, the returns are independent and still the risk could be brought down. There is no risk could be brought down and no risk reduction possible, when the ' $r$ ' value is positive and close to 1 . In the present case, by assuming that the total amount invested is exactly divided into 2 , then the portfolio return is

$$
\begin{aligned}
& =(0.5 * 9.8)+(0.5 * 10.1) \\
& =4.9+5.05=9.95 \%
\end{aligned}
$$

Portfolio Risk $=\boldsymbol{\sigma}^{2} \mathbf{p}=\mathbf{W}_{\mathbf{x}}{ }^{2} \boldsymbol{\sigma}_{\mathbf{x}}{ }^{2}+\mathbf{W}_{\mathbf{y}}{ }^{2} \boldsymbol{\sigma}_{\mathbf{y}}{ }^{2}+2 \mathbf{r} \mathbf{W}_{\mathrm{x}} \mathbf{W}_{\mathbf{y}} \boldsymbol{\sigma}_{\mathbf{x}} \boldsymbol{\sigma}_{\mathbf{y}}$

$$
=(0.5)^{2}(7.23)^{2}+(0.5)^{2}(5)^{2}+2(0.4)(0.5)
$$

(7.23) (0.5) (5)

$$
\begin{aligned}
& =(0.25 * 52.27)+(0.25 * 25)+0.723 \\
& =(13.0675+6.25+0.723) \\
& =20.04 \text { and } \boldsymbol{\sigma}_{\mathbf{p}}=\mathbf{4 . 4 8} \%
\end{aligned}
$$

## Minimum Variance Portfolio

The general formula for estimating optimum weight of two securities $x$ and $y$ is used here. $W$ is the weight of $X$ and the weight of $Y$ will be (1-W).

Weight of X ,
$\mathrm{W}_{\mathrm{x}}=W x=\frac{\sigma_{y}^{2}-\operatorname{Cov}_{x y}}{\sigma_{x}^{2}+\sigma_{y}^{2}-2 \operatorname{Cov} x y}$
By using the data from the example

$$
\begin{gathered}
W x=\frac{25.05-0.04}{52.3+25.05-2(0.04)} \\
W x=\frac{25.05}{77.27}=0.3238
\end{gathered}
$$

i.e. $W_{y}=\left(1-W_{x}\right)=1-0.3238=0.6763$

Based on the above weight, the risk of the portfolio will be $\boldsymbol{\sigma}_{\mathbf{p}}=\left[\left(\mathbf{W}_{\mathrm{x}}\right)^{2} *\left(\boldsymbol{\sigma}_{\mathbf{x}}^{\mathbf{x}}\right)\right]+\left[\left(\mathbf{W}_{\mathbf{y}}\right)^{\mathbf{2}} *\left(\boldsymbol{\sigma}_{\mathbf{y}}^{\mathbf{y}}\right)\right]+\mathbf{2} \operatorname{Cov}_{\mathrm{x}} \mathbf{W}_{\mathbf{x}} \mathbf{W}_{\mathbf{y}}$ $=\left[(0.3238)^{2}(52.3)\right]+\left[(0.6763)^{2}\right.$
$(25.05)]+2(0.04)(0.3238 * 0.6763)$

$$
=(0.1048 * 52.3)+(0.4573 *
$$

$25.05)+0.0175$

$$
\begin{aligned}
& =5.4810+11.4553+0.0175 \\
& =16.9540
\end{aligned}
$$

i.e. $\sigma_{p}=\sqrt{\mathbf{1 6}} .9540=\mathbf{4 . 1 1 7 5} \%$

The above illustration clearly proves the point that, instead of going for equal allocation of funds arbitrarily, by allocating $32.38 \%$ of funds for security x and $67.63 \%$ for security Y would bring down the portfolio risk from $4.48 \%$ to $4.1175 \%$. This kind of mathematical exercise is beyond the reach of common investor who needs a single solution to build the wealth.

## Need for the study

Every other day, a mew tool is added on doing portfolio analysis. Business making continuous loses but based on 'blitz sensing' models are listed in the stock exchanges after mega IPOs. Almost all the conventional tools available in the text books have become redundant. External developments like pandemics, war, natural calamities, etc happen on regular basis reduce any type of analysis just an academic exercise. Therefore, an unconventional method is required to survive and make money in the market. The present study is an attempt to find a fool-proof model for investing in the stock-market.
It was identified that the market index itself has a selfcleaning system over a period of time. For example, nonperforming stocks were replaced from the index (NIFTY) by a performing stock. When market itself is doing such an
exercise, a real time investor can replicate the addition and deletion of the stocks in the portfolio.

## Research Method and Data

The Study is based on secondary data. 10-year data on Nifty - 50 Index stocks were collected from National Stock Exchange database. The study period is between March 2012 - Feb 2022. The annual data were been analysed to know the trend, annual returns and overall returns in comparison with the NIFTY - 50 as benchmark.
The companies exiting the index were removed and the new ones' come in as replacement were added for analysis. Many companies declared bonus shares during the study period. The share price of such companies was standardised for the purpose of analysis. Dividend payments were not considered for the purpose of the study. Obviously, dividend payment payments are not going to changes results negatively.

## Limitations

The purpose of the study is to find a method for people to invest without doing complicated mathematical calculations. The results and findings were specific to the particular period of study. Any generalisation drawn from the study should be used with caution. This method is basically aimed at long term investors and not for day traders.

## Constant weight Index - An Alternative model for Long- Term Investment:

In an attempt to find a model for long term investment, NIFTY 50 index stocks were considered NIFTY has selfcleansing mechanism of dropping the non-performers and induct performers in that place. During the study period of 10 years, between $2012-2022$, about 30 stocks moved out and the same number of new stocks moved in. Therefore, stock selection is done by the market itself. Now, the only concern is to know about the net results of such stocks churning.
The main problem with NIFTY is its biased towards few stocks. Some stocks like Reliance Industries Ltd (RIL), HDFC Twins, TCS, Infosys, etc have more weightage in the index. When the prices of these few stocks go up, Nifty also goes up. A handful of stocks dominate the Nifty 50 index and that nullifies the price movement in other 30-40 blue chip stocks.
To get rid of this issue, unlike the composition of stocks with differential weightage, all the stocks present in Nifty 50 were given equal weightage (Presumably $2 \%$ each), for the purpose of analysis. Therefore, stock selection is done by the market and the appropriate weight ( $2 \%$ each) is assigned by the investor/researchers.
Year-wise for 10 years starting from march 2012 to march 2022 data analysis was done and tabulated. Stock-splits and bonus issues were taken into consideration. The stock prices were normalised for the stock-split and bonus shares, if any, reflect in the total number of shares in the respective scrips. Dividend payments were not taken into consideration and that may not affect the findings adversely. Every year, the new stocks were brought in with the money generated from selling the out-going stocks. That was the only change done in the portfolio on annual basis. A total sum of Rs. 1 Cr was divided equally among the Nifty-50 stocks, for the purpose of analysis.

Table 1: Table Showing the returns between 2012 and 2013.

| 51.NO | Llst of companles | Share Price as on march 1st 2012 | No of Shares | Initlal Investment | $\begin{array}{\|c\|} \hline \text { Share Price } \\ \text { as on march } \\ \text { 1st } 2013 \\ \hline \end{array}$ | Bonus Issue | No of Shares | Portfollo Value as on 1st march 2013 | $\begin{gathered} \text { \% } \\ \text { Change } \end{gathered}$ |

|  | tal Initlal Investr |  |  | 9988996 | Total Value as on 3rd March 2014 |  |  | 10247550 | 3\% |

Between march 2012 and 2013, nine stocks lose their value by more than $25 \%$ and 17 stocks by more than $10 \%$ and six stock recorded marginal loses in single digit. But at the same time, prices of 9 stocks moved up marginally. 5 stocks gained by more than $25 \%$ and 1 stock went up by $125 \%$.

During this period, three stocks were replaced in the index. Reliance Power, Reliance Communication and Sail were dropped and Bank of Baroda, Asian Paints ltd and Lupin Ltd were brought in. The winners in the portfolio were able to more than off-set the losers, and the portfolio went up by 3\%in 2013.

There were only $10 \%$ returns for the portfolio during this period between 2018 Mar-19 Mar. Only L\&T, TCS and Infosys were able to show more than $100 \%$ returns. Very high base effect of the previous year could also be a reason for normal returns.

This year also witnessed major churning of stocks in the portfolio. Titan, Grasim Industries, Bajaj Finserve Ltd, JSW steel and Britannia Industries Ltd found their place for the first time in the Index.

Yes Bank, Indiabulls Housing finance and Zee entertainment were the worst performers during this period. On the other hand, HCL technologies, Tech Mahindra, Wipro and NTPC added strength to the portfolio to witness $17 \%$ returns overall. As expected, nestle replaced

Indiabulls Housing Finance.Yes Bank escaped from the axes for the first time being. Returns at high teens added a lot of positivity to the portfolio value to reach so close to 5 Cr mark. By march 2022 the initial investment of 1 cr has increased almost by five-fold in 8 years.

During the last year of analysis, (2021-22) the model portfolio registered $16 \%$ growth in value. The overall market was resilient during this period in spite of successive covid waves. About 19 stocks showed an impressive growth rate in excess of $25 \%$ Grasim Industries

Ltd (132\%) and Power Grid (421\%) were the top-ranking performers during this period. As on $2^{\text {nd }}$ March 2022, the portfolio value stood at Rs. 7,11,86,848, an impressive more than seven folds rise in value in ten years.

Table 11: Table Showing the Performance of Portfolio Vs Nifty 50.

| Sl.NO | Year | Investment Value | Portfolio Growth y-o-y in \% | NSE | NSE NIFTY Growth |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 2012 | 9988996 |  | 5278.8 |  |
| 2 | 2013 | 10247154 | 3 | 5679.9 | 8 |
| 3 | 2014 | 11576985 | 13 | 6212.25 | 9 |
| 4 | 2015 | 17704998 | 53 | 8885.45 | 43 |
| 5 | 2016 | 16021561 | -10 | 7035.1 | -21 |
| 6 | 2017 | 23023540 | 44 | 8898.6 | 26 |
| 7 | 2018 | 37357914 | 62 | 10447.15 | 17 |
| 8 | 2019 | 40917168 | 10 | 10823.1 | 4 |
| 9 | 2020 | 47758263 | 17 | 11036.25 | 2 |
| 10 | 2021 | 61510618 | 29 | 14638.55 | 33 |
| 11 |  | 2022 | 71186848 | 16 | 16478.65 |

The performance of the portfolio was compared with Nifty50 as the benchmark. Only two years, viz 2012-13 and 2020-21, the Nifty was able to outpace the model portfolio. During all other periods, the model portfolio outshone Nifty with a huge margin of difference. Year-on-year growth rate comparison of the portfolio and Nifty confirms the superiority of the performance of the model portfolio over Nifty.
CAGR of Nifty for the entire period was $12 \%$, whereas, the model portfolio CAGR was $22 \%$, almost double. Therefore, it is easy to infer that the constant index-based investing brings better results than investing in Nifty- ETFs / Index Funds.

## Summary of Findings

1. A long-term investor need not do the stock selection. All the stocks in the index are eligible for investment.
2. The Investible amount to be divided into equal portions towards investments in each stock.
3. It is a passive approach towards investing and the investor needs to sell the stocks which are going out of the index. The sales proceeds need to be invested in the new stocks comes into the index on replacement.
4. Stock splits and bonus shares call for no action from the investors.
5. Dividend amount received should be invested back into the same stocks to pinch the growth of portfolio values.
6. Only heavy weight stocks can influence the Nifty in a big way. In constant index method, any performing stocks can lift the performance of the portfolio. Since all the stocks were invested with equal amounts.
7. Time mitigates risk. One can reap better returns by giving time to the portfolio with appropriate adjustment ss indicated by the Index itself.
8. The portfolio value doubled once in three and half years to four years. Table 11, shows the evidence for the statement.
9. All the Ups and Downs in the market during the intervening periods have no effect on the overall performance of the portfolio over a period of time.
10. There is no tax payment involved since the investor sells only the loss-making stocks for replacement.
11. The investor follows the Markowitz hypothesis of the portfolio diversification. Nifty stocks belong to different sector and not all sector is linearly correlated with very high positive correlation with one another.
12. Though the portfolio is diversified too much, it is easy to monitor and manage. Investors need to follow the changes in the composition of stocks in the Index.
13. There is no need for individual stock analysis, since the portfolio is the replica of the Index.
14. Equal weight assumption removes the pain of doing complicated mathematical analysis for appropriating the capital invested towards various stocks.
15. This approach ensures positive returns for the people remain invested for three or more than three years in the market.
16. CAGR of $22 \%$ for a relatively longer period of ten years gives hope for people without formal education and knowledge about building portfolio could also make money in the market by investing based in constant index.
17. A long-term investor need not worry about the shortterm fluctuations. Governance issues in big companies like ICICI Bank, Yes Bank etc.. or Covid like pandemic which made people to remain indoor have not dampened the spirit of market in the long run. They are all just short-term noises.
18. There is no need for profit booking unlike a short-term trade, once the investor has long-term perspective.
19. Roughly more than $15 \%$ real rate of return (Inflation adjusted) is possible even for a novice investor.
20. Index is the ultimate indicator in the market. Just follow the index, the unerring source of navigation is wealth creation.
